

PROFESSIONAL SUMMARY

AI Engineer with a strong foundation in Deep Learning and Transformer models, with hands-on experience in building end-to-end AI systems including RAG pipelines and LLM-based applications. Proficient in Python, PyTorch, and LangChain for developing and deploying real-world AI solutions. Interested in building scalable and practical AI systems.

CAREER OBJECTIVE

- **Short-term:** Become an AI Engineer, applying knowledge of Deep Learning, Transformer, and LLM systems to build real-world AI applications.
- **Long-term:** Grow into a specialized AI Engineer capable of designing and deploying end-to-end AI systems with high scalability and performance in production environments.

EDUCATION

- **VNU University of Engineering and Technology** Hanoi, Vietnam
Bachelor of Computer Science; Classification: Good 10/2022 – 06/2026 (Expected)

TECHNICAL SKILLS

- **Programming:** Python (data processing, regex, ML pipelines).
- **Deep Learning & AI:** PyTorch, Transformer, Attention Mechanism, Model Training & Evaluation.
- **LLM Systems:** LangChain (LCEL), Retrieval-Augmented Generation (RAG), Embeddings, Prompt Engineering.
- **Databases:** MySQL, ChromaDB (Vector Database).
- **Backend & Deployment:** RESTful APIs, Docker (building & deploying AI services).
- **Tools:** Git, Streamlit.

PROJECTS

- **CV Analysis Assistant (RAG-based)** GitHub
RAG & LLM 07/2025 - 12/2025
Description: Built an AI-powered chatbot for CV analysis using Retrieval-Augmented Generation (RAG), enabling context-aware querying and evaluation of CV content.
Responsibilities: Designed and implemented the end-to-end pipeline, including document preprocessing, retrieval system, LLM integration, and user interface.
Technologies: Python, LangChain (LCEL), Google Gemini API, ChromaDB, Streamlit.
Challenges & Solutions: Improved retrieval accuracy by applying multi-stage retrieval and optimizing embeddings to enhance context quality for the LLM.
Results: Successfully developed a chatbot capable of context-aware CV analysis with stable performance via a Streamlit interface.
- **Peptide Retention Time Prediction (Transformer-based)** Kaggle
Transformer & Deep Learning 09/2025 - 02/2026
Description: Developed a Transformer-based deep learning model to predict peptide retention time in LC-MS data.
Responsibilities: Designed the Transformer architecture, processed peptide sequence data, and trained the model to capture long-range dependencies.

Technologies: PyTorch, Transformer, Python.

Challenges & Solutions: Addressed sequence representation challenges and improved long-range dependency learning using self-attention instead of traditional methods.

Results: Achieved strong performance with R-squared ~ 0.95 , demonstrating accurate and stable predictions.
